

Practical-3

Aim:

To implement Heap Sort using the Heapify technique in C++ and analyze its time complexity

Algorithm:

Heap Sort Algorithm:-
Input:- An array A of n elements.
Output:- Sorted array in ascending order.
Step 1:- Start.
Step 2:- Read the array A and its size n.
Step 3:- Build a Max heap using heapify()
Step 4:- Swap the first element with the last element.
Step 5:- Reduce the heap size by 1.
Step 6:- Apply heapify() to maintain the max heap.
Step 7:- Repeat step 4-6 until the heap size becomes 1.
Step 8:- Display the sorted array.
Step 9:- Stop.

Program:

```
#include <iostream>
```

```
using namespace std;
```

```
void heapify(int arr[], int n, int i) {
```

```
    int largest = i;
```

```
    int left = 2 * i ;
```

```
    int right = (2 * i) + 1;
```

```
    if (left < n && arr[left] > arr[largest])
```

```
        largest = left;
```

```
    if (right < n && arr[right] > arr[largest])
```

```
        largest = right;
```

```
    if (largest != i) {
```

```
        swap(arr[i], arr[largest]);
```

```
        heapify(arr, n, largest);
```

```
    }
```

```
}
```

```
void heapSort(int arr[], int n) {
```

```
    for (int i = n / 2 - 1; i >= 0; i--)
```

```
        heapify(arr, n, i);
```

```
for (int i = n - 1; i > 0; i--) {  
    swap(arr[0], arr[i]);  
  
    heapify(arr, i, 0);  
}  
}  
  
void printArray(int arr[], int n) {  
    for (int i = 0; i < n; i++)  
        cout << arr[i] << " ";  
    cout << endl;  
}  
  
int main() {  
    int arr[] = {12, 11, 13, 5, 6, 7};  
    int n = sizeof(arr) / sizeof(arr[0]);  
  
    cout << "Original array: ";  
    printArray(arr, n);  
    heapSort(arr, n);  
  
    cout << "Sorted array: ";  
    printArray(arr, n);  
    return 0;  
}
```

Output:

```
Original array: 12 11 13 5 6 7
Sorted array:   5 6 7 11 12 13
```

Time Complexity:

Time Complexity:-

Actual optimized Build-Max heap takes $O(n)$
 $n = \text{nodes}$

For $n-1$ swaps, each heapify can take almost
 $\log n$ comparisons.
 $(n-1) O(\log n)$
 $= (n-1)(\log n)$
 $= (n \log n)$

Best case:- $T(n) = O(n) + (n-1)(O(\log n))$
 $= O(n) + O(n \log n)$
 $= n \log n > 0$
 $= n \log n$

Avg case:- $T(n) = O(n) + (n-1)(O(\log n))$
 $= O(n) + O(n \log n)$
 $= O(n \log n)$

Worst case:- ~~$T(n)$~~ height of heap $= h = \log n$
1 heapify $= O(\log n)$
For $n-1$ heapify $= (n-1) O(\log n)$
 $= O(n \log n)$
Worst case $= O(n \log n)$

Conclusion:

Heap Sort was successfully implemented using the Heapify technique. The array was sorted in ascending order with $O(n \log n)$ time complexity.
